

Office 365 Integration [SOAR Support]

PLATFORM FEATURE UPDATE

Adlumin's Office 365 integration now has built-in support for the platform's **Security Orchestration Automation and Response (SOAR)**. This configuration will automatically disable an account when an analytic algorithm determines there is an extremely high likelihood of a compromise across Office 365/Azure services. For example, a successful access event from a foreign country or impossible travel. For this feature to operate nominally you must have Adlumin clients deployed to your domain controllers and be using the Office 365/Azure API integration.

To learn more about enabling Adlumin SOAR support for Office 365, navigate to *Devices > Network Security > Office 365 > Azure API Credentials* within the platform.

The screenshot shows the Adlumin web interface for configuring Office 365 data. The page title is "Office 365 data" and the sub-section is "Azure API Credentials".

Azure API Credentials

Enter Azure credentials for the Office 365 Management Activity API using the form below. Once you have added your credentials, hourly log reporting will begin. To disable API calls to your Azure API, click the trash can icon button below for the domain you wish to delete.

You can utilize the Azure API to integrate with Adlumin's SOAR functionality. This allows for accounts to be automatically disabled if malicious activity is detected. It is recommended that your API key have this functionality enabled - doing so will **NOT** enable the Adlumin SOAR functionality, it simply gives you the ability to do so. To enable SOAR functionality for your Azure API integration, review the **Azure SOAR Documentation**. To enable Adlumin SOAR capabilities for Office 365, navigate to **Security Orchestration Automation and Response (SOAR)**.

- Office 365 SOAR functionality requires a Microsoft 365 E5 subscription.
