

## Mimecast and Okta

### PLATFORM FEATURE UPDATE

Adlumin added two API integrations to the platform: Mimecast and Okta.

Mimecast is an anti-spam and archive filtering service for securing email accounts and businesses communications. This service protects an enterprise's email infrastructure from viruses, malware, and phishing attempts. Mimecast is a cloud-based cybersecurity solution that makes it possible to automate the recovery of archived and affected emails for continuous use. Utilizing the Mimecast API, you can ingest Mimecast MTA into Adlumin.

Mimecast can be found in the platform under *Devices > Email Security > Mimecast*.

Okta is an identity management service built for the cloud but compatible with many on-premises applications. Okta runs in the cloud on a secure, reliable, extensively audited platform, which integrates deeply with on-premises applications, directories, and identity management systems. With Okta, IT can manage any employee's access to any application or device. Utilizing the Okta API with your Okta Developer Account, you can import Okta event logs into Adlumin.

Okta can be found in the platform under *Devices > Network Security > Okta*.
